INTRODUCTION

Seven major rivers discharge the Great Bay Estuary. Flow from these rivers is used to calculate the nitrogen load delivered to the estuary. The New Hampshire Estuaries Project (NHEP) relies on streamgages operated by the US Geological Survey (USGS) to measure daily streamflow on most of the tributaries. In 2005, funding for the streamgage on the Salmon Falls River (Site No. 01072100) was lost. The NHEP provided temporary funding to continue the operation of this gage for one year while long-term funding was sought. The NHEP contracted with the New Hampshire Department of Environmental Services (DES) for this task. DES used the funding to cover the State portion of the operating costs for the USGS gage. The specific task from the DES-NHEP Memorandum of Agreement was:

Streamgaging Task from the 2005 Memorandum of Agreement between the University of New Hampshire (the NHEP host) and the Department of Environmental Services

DES shall partner with the United States Geological Survey (USGS), as part of the jointly funded Cooperative Streamgaging Network Program, to collect data in the Salmon Falls River at the Milton 3 Ponds Dam in Milton, NH. Routine field visits to monitor the function and accuracy of the data collection equipment will be made by both USGS and DES, with USGS taking the lead role. NHEP funds associated with this task will be used to reimburse the state's 50% cost share of the annual gage cost of \$12,460. Typical gaging costs include staff effort and equipment repair/maintenance. Data to be collected includes: reservoir stage for Milton 3 Ponds, river stage (with corresponding discharge), incremental precipitation and air temperature. All data will be near real-time in nature, as the data logged at the field computer will be transmitted every four (4) hours via geosynchronous satellite transmission to a base station at DES's offices in Concord, NH. Each data type will be sampled and recorded at 15-minute intervals for transmission. Data records and management will be consistent with data management guidelines developed by the USGS as part of its National Streamgaging Program.

Interim reports describing project activity shall be provided to the NHEP June 30, 2005 and September 30, 2005. The Final Report shall be provided to the NHEP by January 31, 2006.

Up to \$6,230 of NHEP funds will be used for this task and will be matched by \$18,690 in non-federal funds. Implementation of this activity is relevant to the NHEP Monitoring Plan. [Workplan reference: 05-M-2].

PROJECT GOALS AND OBJECTIVES

The goal of this project was to provide data for one of the NHEP indicators of estuarine condition: NUT1. This indicator reports on “Annual load of nitrogen to the Great Bay from WWTF and watershed tributaries” (NHEP, 2004).

METHODS

Daily streamflow measurements were made at the Milton 3 Ponds Dam on the Salmon Falls River between July 1, 2004 and June 30, 2005. Figure 1 shows the study area.

Routine field visits to monitor the function and accuracy of the data collection equipment were made by both USGS and DES, with USGS taking the lead role. Visits to the site were made by the USGS at roughly 8-week intervals to check equipment and to perform stream channel ratings to ensure the accuracy of collected data. As the equipment associated with this gaging station is housed inside the gatehouse of DES’s Milton 3-Ponds Dam, DES personnel monitored the function of the gaging system’s components.

As a clarification to the information contained in the Memorandum of Agreement task, the provisions of the cooperative agreement between USGS and DES were related to streamflow and the measurement and reporting of this data was performed at the standards typical of the USGS. All other data collected at the site during the period from July 1, 2004 to June 30, 2005, namely lake elevation, air temperature and precipitation, was at the initiative and responsibility of DES. Further, since this data was solely to aid DES in its operational decisions at the Milton 3-Ponds Dam, it did not receive the same level of quality control as the streamflow data did. Gaps in or the incorrect reporting of data values associated with these parameters was frequent. Therefore, data on these parameters have not been included in this report.

RESULTS

The daily streamflow results at the Milton 3 Ponds Dam between July 1, 2004 and June 30, 2005 are provided in Appendix A. A time series plot of the flow over this period is in Appendix B. The monthly average flows measured in SFY2005 were compared to the average monthly flows at this site from 1968 to 2004 (Figure 2). In general, SFY2005 had higher than average flows in the spring compared to the long-term record. The data will be housed in the USGS NWIS database, which is publicly accessible through the Internet at: <http://nwis.waterdata.usgs.gov/usa/nwis/discharge>. The data can be retrieved by querying for Site Number 01072100.

CONCLUSIONS AND RECOMMENDATIONS

Streamflow data for the Milton 3 Ponds Dam will be used to calculate the nitrogen loading indicator for the 2006 NHEP Water Quality Indicator Report.

Long-term funding for the Milton 3 Ponds streamgage was not found. The gage is currently operated by the DES Dam Bureau only to provide information for water resource management decisions. For the 2009 indicator report, the streamflow in the Salmon Falls River will have to be estimated based on streamflow in a similar river system.
