Decadal Reflections: Cart Before the Horse

The expression cart before the horse is an idiom or proverb used to suggest something is done contrary to a conventional or culturally expected order or relationship.
Cuyahoga inlet to Lake Erie circa 1920

"Cuyahoga mouth". Licensed under Public Domain via Commons - https://commons.wikimedia.org/wiki/File:Cuyahoga_mouth.jpg#/media/File:Cuyahoga_mouth.jpg
• Cuyahoga caught fire at least 13 times!
• First, 1868 – Last, 1969
• 5 deaths
  1912
• Largest was in 1952

Cuyahoga River Fire Nov. 3, 1952. Courtesy of Cleveland Press Collection at Cleveland State University Library.
June 22, 1969: Umm, the Cuyahoga River’s on Fire ... Again
Modern Day Equivalent:
Priorities and Water Quality
NPS is Part of the Problem and managing it is part of the solution.

90%
Water Cycle

Typical Annual Water Budget: Developed Watershed

- Precipitation
- Evapo-Transpiration: 25%
- Surface Runoff: 43%
- Groundwater: 32%
Yes, climate change gives us pause to think, but IC is the 800-pound gorilla.
If we know what the problem is...
...and science informs us what we can do...
...Then how are we doing on implementation?
Conceptual Model Factors Influencing Adoption
Technical

Systems failed 2/3 of the time!

- 40% Of the time systems exported more pollutants
- 34% Of the time systems offered some kind of treatment
- 26% Of the time systems did nothing
- 26% Of the time systems did nothing
Conventional Stormwater Management

• Retention/Detention---flood control
• Conveyance---swales, catch basins, gutters
• No recharge or water quality components
Conventional System Design
Shortcomings of Traditional Stormwater Management

1. Inadequate pollutant removal
2. Inadequate cooling
3. Inadequate stream channel protection
4. Lack of maintenance
5. Ready-fire-aim
Low Impact Development

Modeling designs after natural systems
Low Impact Development

LID is an approach to land development (or re-development) that works with nature to manage stormwater as close to its source as possible. LID employs principles such as preserving and recreating natural landscape features, minimizing effective imperviousness to create functional and appealing site drainage that treat stormwater as a resource rather than a waste product.

Goal: **HYDROLOGIC TRANSPARENCY FOR DEVELOPMENT**
How Do They Really Work?
43 in rainfall event in 3 minutes!
LID Designs

“Bioretention Design”

- 381,000 results
Terminology

• Bioretention – Holds WQV. Typically has underdrain, high flow bypass, and hydraulic design

• Rain garden – Holds WQV or less. Commonly for very small watersheds (residential), often do not have an underdrain

• Tree filter – Very little storage. Urban installations include high rate media designed on WQF. For Very small drainage areas, underdrain to storm sewer
System Design

• Above-ground volume
• Inlet
• Layers
  – Media
  – thicknesses
• Surface area
  – Dynamic sizing
• Hydraulic structures
  – Media hydraulic conductivity
  – Secondary
  – Emergency/flood
Bioretention Soil Mix – Many Variations

- Sand: 50-85%
- Wood chips/shredded wood: 20%
- Compost: 10 – 20% \{no compost due to P issue\}
- Soil: 10-30%

- Preferably fines less than 5% (some specs still want 8 – 12%) UNHSC prefers <2%
- 5.5 < pH < 6.5
- Phosphorus index 10-30
- CEC > 10
UNHSC Bio Mix

- 50% Sand,
- 30% loam
- 20% wood chips

2% WTR + 98% UNHSC
Influent
Internal Storage Volume

• Promotes denitrification
  – May need liner at base in high K soils
  – > 1 ft thickness
  – Need to create plug flow through ISV
  – The longer the residence time, the better
    • > 1/3 of WQV
    • > 12 hours
Media Thickness

• Depends on plant root depths:
  – 12 in. for grasses, forbs
  – 18 – 24 in. for shrubs (NHDES min 18”
  – > 30 in. for trees

Do not want roots to clog stone layer and drain pipe below the soil
Vegetation

- Native plants always the best
- Cooperative Extension, USDA, NRCS good sources

- Forest
- Meadow
- Transition
- Ornamental
Plants

- There is little consensus and data WRT bioretention system plantings.
- Most manuals are out of step and out of date.
- Planting decisions should be based on owner perceptions of O&M.

Social

Conceptual Model Factors Influencing Adoption
Diffusion of innovation is the process by which an innovation is communicated through certain channels over time among the members of a social system (Rogers, 2003)
Adapted from Rogers, 2003
Results from Ryan and Gross on farmer adoption patterns of hybrid corn.

Source: Ryan & Gross (1943), “The Diffusion of Hybrid Seed Corn in Two Iowa Communities,” Rural Sociology 8 (March): 15.

Priorities and Water Quality
Advocates Fear Scott Administration Is Weakening Landmark Water Quality Law

By PETER HIRSCHFELD  •  JAN 17, 2018

The Vermont Clean Water Act will hold more than 1,000 properties across the state to stricter stormwater standards, but environmental advocates say the Scott administration is trying to undermine some key provisions.
“The study really revealed that the penalty for so-called under-sizing a system was not as great as we believed it would be,” Houle says. “It means that there’s a lot of benefit for doing what you can where you can how you can.”

So does that mean Vermont can get away with holding legacy sites to a lower volume standard? Here’s how Houle answers that question:

“Managing stormwater is relatively recent science, and the way I look at it is, we can benefit from implementation, whatever that implementation is,” Houle says. “I would be less likely to promote one sizing criteria over another, and more likely to say, ‘We have a major problem that we’ve swept under the rug for decades, and it’s time that we start to implement. And however you want to get to implementation, I think I’m fine with for now.”
