* high value for future precipitation represent maximum value from downscaling output from four GCM (CCSM, GFDL, HADCM3, PCM) for a high emissions scenario (A1Fi)
Lamprey River Watershed - Build Out Rates

- Residential Development: 239 acres per year
- Commercial and Industrial Development: 35 acres per year
Mapping Buildout

Starting with total watershed acreage, eliminate:

- Developed land
- Hydric soils/wetlands/surface water
- Steep slopes (> 15%, based on soils)
- Conservation lands; public water supply protection areas

Build out flat terrains first, moving incrementally to steeper slopes

Within a slope category, build out areas closest to roads first
Hydrologic Methodology

- **FIS:** Annual peak flow frequency analysis
  - peak annual stream flow
  - standard deviation
  - weighted coefficient of skewness
- **Lamprey River Project:** Rainfall-Runoff Model
  - Watershed area
  - Time of concentration
  - Runoff curve number (CN)

Hydrologic Modeling: HEC-GeoHMS & HEC-HMS
Hydraulic Modeling: HED-GeoRAS & HEC-RAS
Curve Number: Rainfall – Runoff Equation

Curves on this sheet are for the case $I_a = 0.2S$, so that

$$Q = \frac{(P - 0.2S)^2}{P + 0.8S}$$
Curve Number based on Land Use and Soil Type

Hydraulic Calibration – Results for RT108

Durham Boat House
April 2007: modeled = 34.4’ observed = 34.1’
March 2010: modeled = 33.6’ observed = 33.3’
Current 100 yr flood = 35.8’
FIS 100 yr flood = 33.0’

• 45% increase in the 100-year flood flow from USGS gage: 7,300 cfs (FIS) to 10,649 cfs (NRCC)
• An increase in the base flood elevations by an average of 2.7 feet along the 36 mile study reach.
Implementing LID

Influence of LID is minimal below 3-7% IC and greatest for high IC and poor soils.

New Flood Plain Maps and Questions of Legal Authority, Measures and Consequences
In Collaboration with Vermont Law School

1. What is the potential liability of government if they fail to reduce vulnerability to flood risk based on UNH’s information?

2. What legal and policy approaches may communities adopt to reduce flood risks in the expanded flood hazard area?

3. Do NH communities have the legal authority under state legislation to design and implement regulatory controls based on current and projected flooding levels?

4. What legal standard of scientific and technical reliability must be met to support regulatory measures based on current and future environmental conditions?

5. What is the potential regulatory takings exposure of communities if they impose regulatory controls that are designed to address anticipated future environmental conditions?

Newmarket Effective 100 Year Floodplain
Assessing Flood Risk - Lamprey River Watershed

Advisory Committee
municipal, regional, state, federal and non-profit representation

Cliff Sinnott, Rockingham Planning Commission (Chair)
Joanne Cassulo, NH Office of Energy and Planning
David Cedarholm, Durham Public Works
Cynthia Copeland, Strafford Regional Planning Commission
Michael Goetz, FEMA Region 1
Diane Hardy, Newmarket Planning Department
Sharon Meeker, Lamprey River Advisory Committee
Jack Munn, Southern New Hampshire Planning Commission
Jennifer Perry, Exeter Public Works
Ron Poltak & Becky Weidman, NEIWPC
Keith Robinson, USGS
Carl Spang/Dawn Genes, Lamprey River Watershed Association
Eric Williams, NH Department of Environmental Services
Assessing Flood Risk - Lamprey River Watershed

Technical Analysis
Construct hydrologic and hydraulic model
Develop land use and climate change scenarios
Run model; plot cross-sections; map results

Dissemination
Advisory Group & Focus Groups
Community Workshops
Municipal & Regional Planners
NH GRANIT website

Evaluation and Feedback
**Project Objectives:**

- Assess flood risk associated with **combined** land use and climate change scenarios out to 2100
- Produce **maps** of the 100-year flood risk boundaries and **river discharge** at specific locations
- Demonstrate the use of our products to support land use decision-making in coastal communities
- Serve as a model for other New England watersheds
- Address legal issues of using projected flood information
Projecting Future Climate Change for the Northeast: Greenhouse Gas Emission Scenarios

The diagram illustrates the projected CO₂ emissions (Gt C) for different emission scenarios from 2000 to 2100. The scenarios include A1B, A1T, A1FI, A2, B1, B2, and IS92a. The emissions increase significantly from 2000 to 2080, with some scenarios showing a steep rise and others leveling off. By 2100, the emissions for some scenarios are projected to be significantly higher than in 2000.
