## New Hampshire STD/HIV Surveillance Program 5 Year Data Summary Report 2006-2010

### Data Notes:

All Data in this report are based upon information provided to the New Hampshire Department of Health and Human Services under specific legislative authority. The numbers may represent an underestimate of the true absolute number and incidence rate of cases in the state. Any release of personal identifying information is conditioned upon such information remaining confidential. The unauthorized disclosure of any confidential medical or scientific data is a misdemeanor under New Hampshire law. The department is not responsible for any duplication or misrepresentation of surveillance data released in accordance with this guideline. Population data used in this report come from the most recently available U.S. Census Bureau population estimates. All data in this report are complete as of September 12, 2011.

\* = Case rate per 100,000 persons. Case rates calculated on events <20 are considered statistically unreliable and should be interpreted with caution.

The Infectious Disease Surveillance Section restricts the release of calculated rate data to cell sizes  $\geq 5$  cases.

† =County data is based upon residence at time of disease diagnosis. ¶ = Hispanic may be of any race.

X= MSM= male-to-male sexual contact, IDU = injection drug use, NRR=no reported risk, and NIR= no identified risk.

Heterosexual contact: The Centers for Disease Control and Prevention (CDC) changed the term in the mode of transmission category from "high-risk heterosexual contact" to "heterosexual contact". This is clarified in the report "Diagnoses of HIV infection and AIDS in the United States and Dependent Areas, 2008", released in July 2010. Persons whose transmission category is classified as heterosexual contact are persons who report specific heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., an injection drug user).

\*\* = Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis.

\*\*\* = Indicates a new diagnosis of AIDS in the specified year, regardless of when diagnosed with HIV.

Other = hemophilia/coagulation disorder; receipt of blood transfusion, components, or tissue.

Pediatric=mother with or at risk for HIV.

Data sources: Sexually Transmitted Disease Management Information System (STD MIS), enhanced HIV AIDS Reporting System (eHARS), and Environmental Systems Research Institute (ESRI) ArcMap.

Concurrent diagnosis is defined as receiving an AIDS diagnosis within 12 months of an initial HIV diagnosis.

2010 concurrent diagnosis data is provisional and not yet validated.

2010 concurrent diagnosis data may increase when data are finalized.
