Abstract
Foreign aid is one of the foremost policy tools that high-income countries use for supporting low-income countries to increase economic growth and improve the well-being of the population. However, the empirical evidence for positive outcomes has been very mixed. Using a sample of 85 countries this paper investigates whether the timing of foreign aid allocations is an important factor in determining aid’s effectiveness. The results indicate that foreign aid is 2 to 3 times more effective if awarded during times of natural disasters. The paper also shows that aid allocated during such times increases by about 1\% of a given country’s GDP. No evidence was found that aid has a more positive impact on growth in countries with good policy environments.
