Public Acceptance of Human-Caused Climate Change Is Gradually Rising

Lawrence C. Hamilton

Have recent extreme weather events in the United States shifted public opinion on climate change? In late summer and fall 2017, disaster headlines were common. Hurricanes caused damage along the Gulf Coast, and brought devastation to Puerto Rico and the Virgin Islands. The West experienced severe wildfires, with 2 million acres aflame at one point. Although attributing particular events to climate change is difficult, scientists have noted that such extremes are becoming increasingly frequent as climate warms.¹

The graph tracks 36 nationwide and New Hampshire surveys since 2010 that all asked the same climate question.² Over this period, the percentage who say that climate change is happening now, caused mainly by human activities, rose gradually from low-50s to mid-60s.³ In October, a New Hampshire survey reached 68 percent. That appears consistent with extreme-weather effects—but it is too soon to know whether it will last. As the graph shows, in previous years, climate views did not respond quickly to events, but they have been drifting slowly upwards.⁴

PERCENTAGE AGREEING THAT CLIMATE CHANGE IS HAPPENING NOW, CAUSED MAINLY BY HUMAN ACTIVITIES (SHOWN WITH SOME CLIMATE-RELATED EVENTS)
