New England Households Rely on a Mix of Child Care Arrangements

Jess Carson

Analyses of data collected by the U.S. Census Bureau between January and May 2023 show that 70.4 percent of New England households with a child under age five used at least some child care in the past seven days. However, analysis of type of care used demonstrates that more than one-third of these households are juggling multiple care arrangements to meet family needs (Figure 1). Households using care report center-based care as the most common arrangement (61.3 percent), although just 30.2 percent use only that type. About half of those who use center-based or relative care use only those forms, while between one-quarter and one-third of those using non-relative or home-based care use only that kind of care. Findings suggest that even having access to a formal slot in center- or home-based care may not be sufficient for meeting families' needs. Finding the right type and mix of care is complex and underscores the need for flexible and diverse child care options for New England families.

Seventy percent of New England households with a child under five use child care, and more than one-third of those rely on multiple arrangements.
