### UNH students deliver sustainable energy to Ghana school

Monday, July 11, 2016

"SEEING THE EXCITEMENT ABOUT SOLAR ENERGY GROW THROUGHOUT THE WEEK WAS EXTREMELY POWERFUL. WORDS CANNOT DESCRIBE HOW IT FELT TO SEE THE TRAINEES WORK WITH THE SOLAR DISTRIBUTOR TO BUILD THEIR SYSTEM AND HELP BRING ENERGY TO THIS SCHOOL," SAYS KATERINA MESSOLOGITIS '15, WHO WAS ON SITE FOR THE FINAL INSTALLATION PROCESS IN TOH KPALIME.

Two years ago, five UNH students had a vision to deliver a reliable and sustainable energy system to a community in need.

In January, that vision became a reality when the Takumi Community School in Toh-Kpalime, Ghana, was outfitted with a

1.2-kilowatt solar energy system through UNH Solar Power for Schools (UNHSPS), a project that will improve the quality of education, allow for community meetings and power technologies that drive economic development in a sustainable way.

“Seeing the faces of the trainees once the lights were turned on for the first time was so incredible,” said Katerina Messologitis ’15, a current civil engineering graduate student and UNHSPS project manager. “This trip was about more than just solar panels on a roof. It was about building community capacity, planting a seed of knowledge about solar energy and strengthening our relationship with the community.”

Joining Messologitis on the project were Zachary Angelini ’14, Taygra Longstaff ’15, Abygail Mangar ’14 and Tegan O’Neill ’14. Angelini is a UNH graduate student in civil engineering, and O’Neill is a UNH political science graduate student.

All five students spent some time in Ghana during the winter break to assist in the planning, installation and maintenance training of the solar panel system.

“My hope is that a quality education provided by solar energy will equip and inspire these students to become future leaders who can direct their country toward a sustainable future,” says Angelini. “This experience was eye-opening for me to see firsthand how challenging development work can really be.”

The six-panel system powers lights and fans in the three-building school complex that serves more than 175 students from multiple villages. The low-maintenance solar system is expected to last 25 years with a 10-year battery replacement. The project cost \$30,025 and was funded by a variety of sources including the UNH Parents Association, the UNH Emeriti Council SISI Grant, the College of Engineering and Physical Sciences and the UNH Social Venture Innovation Challenge, as well as donations from various individuals and engineering firms.

“Our UNH experience has been defined by these projects that couldn’t happen without the help of others,” says O’Neill. “We realized we can start making that possible for other students. We want UNH to have this legacy that’s international and service-oriented; the fact that we can make a little contribution to that was meaningful for all of us.”

The UNH students' effort began as a senior capstone project in 2014. They connected with a Canadian nonprofit organization, DevXchange International, which had a connection to the village. Messologitis and Angelini traveled to Ghana in August 2014 to meet community leaders, interview solar companies and select the firm best matched to help meet project goals.

Before their return visit, the group worked remotely with Atlas Business Energy Systems and community leaders to determine the size and placement of the panels and how to secure the panels. They also developed a training and education program to ensure the panels would be properly maintained.

Mel Rines '47, the Emeriti Council's co-chair, was instrumental in launching the EC-SISI fund, which helped pay for SPS' work and travel. His support was the result of his career in international investment banking, part of which he spent raising capital for the African Development Bank.

Originally the grant program was meant to benefit projects in Africa, but now, students can go anywhere. Rines hopes the grants will expand to other areas of interest such as nursing or education. “It’s like the Peace Corps, just on a smaller scale,” he says. “These students are really an inspiration for all of us.”

Environmental engineering professor James Malley, who served as a technical and academic advisor on the project, says he is proud of the students' ability to navigate the challenges and finish the project successfully.

“This project is the perfect example of experiential learning, interdisciplinary education and building leadership skills,” says Malley. “It teaches UNH students about the societal, economic and technical aspects that are important to performing an engineering project.”

The project also served as a learning experience for the community members and schoolchildren in Ghana. The village often faces power outages during peak usage times, and with the new system, those outages will be eliminated. The project allowed UNH students to show the difference between renewable, reliable and sustainable power versus a system that is unreliable, not sustainable and nonrenewable.

Though the UNH students are confident in the community’s ability to maintain the system and plan for future maintenance, they are planning a return trip next year.

“We want to return so we can determine any challenges the community has encountered with the system, continue solar energy education and work with the community to develop revenue streams that can be used to expand the system,” Angelini says.
