UNH Space Science Center Offers Out of This World Experience

Monday, June 1, 2020

(HTTPS://WWW.UNH.EDU/UNHTODAY/NEWS/2020/06/01/unh-space-science-center-offers-out-of-this-world-experience)

DURHAM, N.H.—Scientists from the University of New Hampshire’s Space Science Center will use a \$4.6 million grant from NASA to create a project that will offer a diverse group of college students from across the country hands-on research experience designing and building small satellites that will be launched into outer space and collect data for one of NASA’s space missions.

The Student Collaboration Project, led by Noé Lugaz, a research associate professor of physics, aims to work in conjunction with NASA’s Interstellar Mapping and Acceleration Probe (IMAP) mission and build off of the collected data to provide firsthand research experience for undergraduate and graduate students and help to diversify the field of space science.

“We’re missing out on so much potential with great people out there,” said Lugaz. “Most science projects are publicly funded, and we want to expand access to college students who are qualified and have a passion for science to get involved, no matter what their major. We are hoping to inspire them, even if it’s just for one year. We think we can really start to make a difference.”

Project coordinators will recruit the first group of students from three universities—UNH, Howard University in Washington, D.C. and Sonoma State University in California. During the five-year project, students from each university will design and build a CubeSat—a small satellite the size of a half-gallon of milk—that will have an instrument that can quantify the concentration of oxygen in the Earth’s upper atmosphere and provide scientists with clues about the effects of the solar wind. This is the region where many satellites are located and knowing more about the atmosphere’s density could help determine their orbit and lifetime.

“The students from each university have a variety of strengths and experiences that will allow them all to learn from one another,” said Lugaz. “They’re not just doing this on their own, they’ll be collaborating and interacting with each other via online learning tools and technology so they can talk to one another and learn together.”

The student built CubeSats will launch in 2024 separately from the main IMAP mission but at the same time in order to collect complementary data. The CubeSats will be in space for about four months and will be located much closer to the Earth than the other IMAP instruments.

UNH was chosen as the lead because of its strong space physics program and its history of students developing payloads for numerous rocket science missions. Other UNH SSC scientists involved include Marc Lessard, professor of physics, and Jason Legere, research engineer, who will provide mentoring and Sonya Smith, a UNH project manager, will provide support.

The University of New Hampshire (<http://unh.edu>) inspires innovation and transforms lives in our state, nation and world. More than 16,000 students from all 50 states and 71 countries engage with an award-winning faculty in top-ranked programs in business, engineering, law, health and human services, liberal arts and the sciences across more than 200 programs of study. As one of the nation’s highest-performing research universities, UNH partners with NASA, NOAA, NSF and NIH, and receives more than \$110 million in competitive external funding every year to further explore and define the frontiers of land, sea and space.
